

# ADB

- [Shizuku](#) ★ | [Official Site](#) | [Playstore](#) - **Allow ADB easily from your android itself.** Just connect to any Wifi network and start adb using shizuku.  
| It also allow normal apps to use system APIs directly with adb/root privileges.

Connect it to **Termux** and start `adb shell`.

**Issue of termux normal adb way and how shizuku solve it :** Using adb in termux from android device in which we want to connect through adb is hard!! Because changing to termux after seeing PIN from developer setting > wireless debugging, change the PIN !!. **So Shizuku allow entering PIN to pair device with adb through notification bar**

Use it for tasks like "Extracting Genshin Impact wish history url using `tomcat` for using it on <https://paimon.moe>

- [webADB](#) - The best way to control and manage your android device using just the browser! Nothing to install or setup, just plug and play!
